Rubber-based Adhesives

Rubber-based pressure sensitive adhesives contain tactifiers that are heated and applied to the surface of the tape. Typically rubber-based adhesives have a good initial tack and quick set-up times. These types of adhesives have a light straw color, and may show through on white or light shades of tape.

Water-based Adhesives

Water-based pressure sensitive adhesives contains adhesive polymer that is suspended in water prior to being cured in an oven. Once cured, these types of adhesives tend to withstand moisture and heat elements better than rubber based pressure sensitive adhesives, and are more resistant to breaking down over time.

VELCRO® brand 72

A water-based acrylic pressure sensitive adhesive for high temperature performance and superior bond strength for uses in Automotive, Computer, Medical and other markets.
